## Highlights

---

- Canadian cattle farmers had just over 12.5 million cattle on their farms as of January 1, 2012, up 0.5% from the same date a year earlier.
- The inventory of beef cows fell by 1.0% to 4.2 million head, continuing a downward trend that started in January 2006. However, the January 1, 2012 inventory of beef replacement heifers increased by 4.3% to 554,300 head.
- Canadian farmers had about 1.4 million dairy cows and heifers on their farms, roughly unchanged from January 1, 2011.
- In 2011, cattle and calf slaughter totalled 3.5 million head, down 7.5% from 2010 and down 6.5% from 2009.
- There were an estimated 689,300 head of cattle and calves exported in 2011, down 35.2% from 2010 and 35.4% below the level of 2009.

## Analysis

Cattle inventories increased in 2011 as prices improved throughout the year. Canadian cattle farmers had just over 12.5 million cattle on their farms as of January 1, 2012, up 0.5% from the same date a year earlier; the first year-over-year increase in seven years.

The inventory of beef cows fell by 1.0%, continuing a downward trend that started in January 2006. However, the January 1, 2012 inventory of beef replacement heifers increased 4.8% in the Western provinces and increased 1.0% in the East. Overall, inventories of beef replacement heifers rose 4.3%. The increase in replacement heifers indicates that producers are beginning to replenish the herd with younger cows.

Canadian farmers had about 1.4 million dairy cows and heifers on their farms, roughly unchanged from January 1, 2011.

Cattle on feeding operations in Canada were higher by 4.0% at January 1, 2012 from a year earlier. Heifers and calves were seen to have increased by 2.7% and 15.2% respectively, while the number of steers declined 1.2% from a year ago.

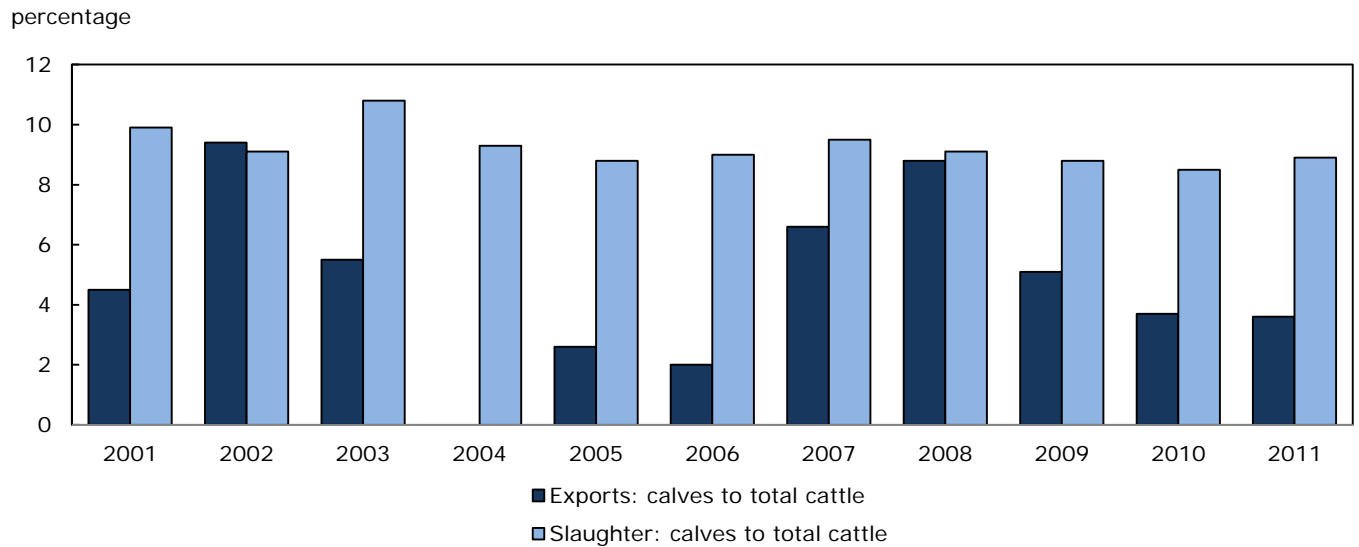

In 2011, cattle and calf slaughter totalled 3.5 million head, down 7.5% from 2010 and down 6.5% from the same period in 2009. On average, 3.7 million head were slaughtered in Canada in each of the previous five years.

There were an estimated 689,300 head of cattle and calves exported in 2011, down 35.2% from 2010 and 35.4% below the level of 2009.

**Chart 1**  
Exports and slaughter of cattle including calves, annual, Canada, 2001 to 2011

**Chart 2**  
Percentages of calves in total exports and in total slaughter, Canada, 2001 to 2011

## **Farm type and number**

An estimated 95,105 farms reported cattle and calves as of January 1, 2012, down 1.4% from the same date last year and down 4.3% from two years earlier. Beef producers account for approximately 85% of the total number of farms with cattle in Canada.

Beef cattle production takes place mainly on three types of cattle farms. At January 1, 2012 there were 66,595 cow-calf operations, 10,865 cow-calf backgrounding operations, and 2,945 feeding operations in Canada. The bulk of Canadian beef cow inventories (93.0%) were on cow-calf operations.

Usually more than half the heifers for slaughter and steers inventories in Canada, at January 1, are reported to be on feeding operations. The Western provinces had 31.6% of the total feeding operations and accounted for 76.8% of the Canadian cattle inventory on feeding operations on January 1, 2012.

There were 16,270 farms reporting dairy cattle at January 1, 2012 with 85.6% of those operations located in Eastern Canada. Specialised dairy farms accounted for 88.0% of all farms producing dairy products. There were 1,570 farms in Canada that kept both a dairy and a cow-calf (beef) herd on the same operation. The number of operations with dairy cattle that reported veal production was 1,155 at January 1, 2012.

1. For the January to June period, the beginning inventory is dated January 1 and the ending inventory is dated July 1. For the July to December period, the beginning inventory is dated July 1 and the ending inventory is dated January 1. The inventory data for each period cannot be aggregated to make an annual total. The inventory data is a count at a specific point in time.

# Concepts and methods

---

## Concepts

### Livestock statistics

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

## Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs and sheep, referring to inventories at the 1st of the month. The probability samples include about 10,260 operations at January 1, and about 10,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are approximately 2,100 operations and 2,500 operations, respectively, at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle, hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are about 1,000 operations in June and 1,100 operations in November. The results are released at the same time

as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

The total inventories are now distributed to a specific farm type, on the basis of survey results and sector level balance sheets. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

Canadian exports to the United States are obtained from U.S. import custom documents and are officially released by the International Trade Division of Statistics Canada. These data try to register the province of origin of the commodity, but when unknown, will reflect the province of entry into the United States. Information from secondary sources is used by Agriculture Division of Statistics Canada to better estimate the province in which the commodity was raised/grown. Administrative data from the provinces are used to adjust the export numbers by province to better reflect provincial production. Though this methodology will result in different exports by province, the Canadian export totals will equal those released by International Trade Division. At release, some export data are unavailable. The missing data are imputed based on historical and auxiliary data sourced from the United States Animal and Plant Health Inspection Service. The imputed data are replaced with actual International Trade data when it becomes available.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
