Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Concepts and methodology	61
--------------------------	----

Highlights

- At October 1st 2008, Canadian hog producers reported their inventories at 12.8 million, down 1.5% from the previous quarter and about 11% from a year ago.
- The breeding herd is down over 8% from last year.
- Hog production per sow continues to be higher in the West, as opposed to the East.
- Hog exports continued their decline from the first quarter, while slaughter decreased slightly from the previous quarter.

Analysis

Canadian Swine inventory decline continues

At October 1st 2008, Canadian hog producers reported their inventories at 12.8 million, down 1.5% from the previous quarter and about 11% from a year ago. The hog numbers began their decline three years ago, as rising input costs for feed coupled with declining hog commodity prices cut into the profit margins for producers.

Although hog inventories had levelled off at the beginning of 2008, they continued to decline slightly over the past two quarters. Uncertainty surrounding the U.S.A. Country of Origin Labelling (COOL) rules, which came into effect on September 30th 2008, and the Manitoba hogs moratorium legislation, were major events that occurred during the third quarter. For the most part, producers are waiting to see how buyers and markets in North America will react to the new labelling rules. Several hundred operations also took advantage of the Federal Cull Breeding Swine Program to scale down their breeding herd over the last few quarters.

For the most part, there has been a downward trend in commodity and class. There have, however, been increases in large size market pigs in Quebec and Manitoba, which may be due to interprovincial movement and in particular, for Manitoba to hold on to large market pigs because of market limitations.

The national breeding herd is down over 8% from last year. Registrations from the Cull Breeding Swine Program indicate that 124,000 breeding animals have been taken out of the herd since November 1, 2007. Under this federal program, the registered barns must remain out of production for at least three years.

The breeding herd is declining at a lower pace in the West, which may explain why the West is still increasing its share of the national breeding herd. Hog production per sow continues to be higher in the West as opposed to the East, with new technology and farm management improvements. Within the last decade, sows increased by 2% in the East compared with 21% in the West. Western provinces account for 46% of the breeding herd and 49% of the hog production in Canada.

For the last two quarters, hogs exports continue to stand at about 2.1 million head. Year to date exports for January to September 2008 are up by 0.9% from last year, while domestic hogs slaughter reported a marginal decline of 0.1% from a year ago.

Canadian hogs producers have had to cope with very narrow or even negative profit margins in the past several years. The hog price cycle has traditionally been described as a three year cycle. In the past, prices paid to producers for slaughter hogs have remained low for an unusually long period of time. The increased price of coarse grains, which are used in feed, and which normally account for almost half of the hog farm operating expenses, has reduced profit margins. In 2008, the average price received by hog producers was 21.7% below the price for the first half of 2007, as robust U.S.A. hog production and the higher Canadian dollar continued to apply downward pressure on prices.

Financial pressures, the Canadian currency overtaking the American dollar, the hog moratorium, the U.S.A. COOL labelling legislation and the uncertainty over market conditions, has created a changing environment for the Canadian hog producers. Structural changes, barn and farm closures have taken place in the hog industry, as almost 16% of Canadian hog producers left the industry since October 2007. Among all hogs farms, regardless of size or degree of efficiency, the most financially vulnerable have been at risk.

Total disposition

1. Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.
2. Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.
3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

Total disposition

1. Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.

2. Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.

3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

Concepts and methodology

Livestock statistics

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,250 operations at January 1, and about 16,250 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are approximately 2,100 and 2,500, respectively, at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle, hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are about 1,000 in June and 1,100 in November. The results are released at the same time as the livestock results.

For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

The total inventories are now distributed to a specific farm type, on the basis of survey results and sector level balance sheets. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

Canadian exports to the United States are obtained from U.S. import custom documents and are officially released by the International Trade Division of Statistics Canada. These data try to register the province of origin of the commodity, but when unknown, will reflect the province of entry into the United States. Information from secondary sources is used by Agriculture Division of Statistics Canada to better estimate the province in which the commodity was raised/grown. Administrative data from the provinces are used to adjust the export numbers by province to better reflect provincial production. Though this methodology will result in different exports by province, the Canadian export totals will equal those released by International Trade Division.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
