

Made-in-Manitoba Climate and Green Plan

What it Means for Carbon Revenue Recycling

Carbon Revenue Generated

Carbon pricing generates revenue that can be recycled back into the economy to help people and grow businesses. At \$25 per tonne, Manitoba's carbon price is currently estimated to generate about \$260 million in revenue annually. Revenue estimates vary depending on the amount of fossil fuel consumed. That revenue will decline over time as emissions are reduced.

Revenue Recycling Principles

Three principles for revenue recycling will be established:

1. All revenue collected will go to Manitoban priorities.
2. All revenue collected and distributed will be accounted for and reported annually to the public.
3. All revenue collected will focus, first and foremost, on reducing the carbon levy impact on lower and middle-income Manitobans and their families.

Carbon revenue recycling to households and families

Revenue Recycling Options

The following revenue recycling options are being considered:

Relief to Households

This revenue recycling option would see carbon revenue used to help offset increased carbon price costs to Manitoba households, especially those with low and middle-incomes.

Investing in Green Projects, Business Competitiveness, and Clean Technologies

This revenue recycling option could see carbon revenue invested into safeguarding business competitiveness and investing in green projects and clean technologies that create jobs and support low-carbon growth.

Adapting to Climate Change

This revenue recycling option could see some of the carbon revenue focused on building green, resilient infrastructure such as agricultural drainage systems and water retention that help protect communities against extreme weather events.
