Subject: Gimli WWTP Request to Dispose of Biosolids to Landfill - Responses to Questions

Asit,

Please find below the responses to your questions asked yesterday:

- 1) How will the biosolids be transported to the landfill?
Response: By Septic or Hydrovac truck using approved commercial haulers.

- 2) How will the biosolids be covered in the landfill?
Response: After the disposal of the biosolids in the cell, the clay material currently stocked piled on-site will be placed on top. This material is from the excavation of the cell. A detailed plan to close the cell will be submitted to Manitoba Sustainable development when the RM is closer to closing the cell.

- 3) What is the quantity of solids that will be deposited?
Response: At this point, an exact quantity is still unknown. The mixed liquor level in SBR 2 is at about 1 m of depth and the contents are still pumpable to SBR 1. The diffusers in SBR 2 appear from the surface to be still functional so there will be less solids than found in SBR 1. A potential range of what may need to be removed from the bottom of SBR 2 is 20 to 80 m³ of solids.
