Immunization has saved more lives in Canada in the last 50 years than any other medical intervention. Vaccines help the immune system to recognize and fight bacteria and viruses that cause disease.

**What is seasonal influenza?**
Seasonal influenza (the flu) is a respiratory infection caused by a virus. Not everyone who gets the flu develops symptoms, but they can still spread it to others, especially if they cough or sneeze. The flu can seem similar to the common cold, but the signs and symptoms of the flu are usually more severe. Sudden high fever, body aches, extreme tiredness and dry cough are more common with the flu than the common cold. Other common symptoms include headache, chills, loss of appetite and sore throat. Nausea and upset stomach may also occur, especially in young children. The flu can lead to more serious problems like pneumonia and bacterial infections, sometimes resulting in hospitalization.

The flu can spread easily from person to person through coughing, sneezing or sharing food or drinks. You can also get the flu by touching objects contaminated with flu virus and then touching your mouth, eyes or nose. For this reason, it's important to cover your nose and mouth with your forearm when you cough or sneeze and wash your hands often with soap and water (or hand sanitizer if soap and water are unavailable), especially after coughing and sneezing.

The flu season in Manitoba usually begins in the fall and lasts into the spring. For your protection, you should get immunized early in the fall before the flu starts to circulate.

**What is the flu vaccine?**
There are many different strains of flu virus that circulate each year. The flu vaccine does not protect against all of them. Every year, scientists monitor the global spread of flu and decide which flu strains will likely cause the most illness during the flu season. Those strains are then put into the flu vaccine for that year so each year, the vaccine is different. For this reason and because protection provided by the vaccine decreases over time, it's important to get the flu vaccine every fall.

The flu vaccine cannot offer protection against other viruses or bacteria that cause the common cold or stomach flu.

This year, a new flu vaccine is being offered to people 65 years of age or older who are living in long-term care facilities in Manitoba. This vaccine, known as Fluzone® High-Dose, is safe, effective, and will not cause the flu because it does not contain any live viruses. Fluzone® High-Dose is a trivalent inactivated vaccine (TIV) and protects against three (2A + 1B) of the influenza strains predicted to be circulating in North America during the 2017-18 seasonal influenza season. Fluzone® High-Dose is given by injection (needle) and is expected to provide better protection against seasonal influenza, compared to the standard inactivated influenza vaccine.

**Why should people get the flu vaccine?**
Immunization is the best way to protect yourself against the flu, which can often be serious and sometimes fatal.

Vaccines help prepare your body to fight potential future exposure to the flu by getting your immune system ready.

The vaccine helps protect you, your family and other people in your community.

**Who should get the flu vaccine?**
An annual flu vaccine is available free-of-charge to all Manitobans six months of age and older as part of Manitoba’s routine immunization schedule.

---

1 Public Health Agency of Canada
You should get immunized early in the fall before the flu starts to circulate.

An annual flu vaccine is especially important for Manitobans at increased risk of serious illness from the flu, their caregivers and close contacts. This includes:

- People 65 years of age and older
- Residents of personal care homes or long-term care facilities
- Children six to 59 months of age
- Individuals with the following chronic health conditions:
  - An immune system weakened by disease or medical treatment
  - Cardiac or pulmonary disorders (e.g., cystic fibrosis, asthma)
  - Individuals aged six months to 18 years on long-term acetylsalicylic acid (Aspirin®) therapy
  - Neurologic or neurodevelopmental conditions
  - Diabetes and other metabolic diseases
  - Renal disease
  - Anemia or hemoglobinopathy
  - Obesity (body mass index ≥ 40)
- Pregnant women
- Health care workers and first responders
- Regular caregivers of children up to five years of age
- Indigenous peoples

Fluzone® High-Dose is available free-of-charge for Manitobans 65 years of age and older who live in long-term care facilities.

Who should NOT get the flu vaccine?

Anyone who has had a severe allergic reaction to a previous dose of any flu vaccine or to any of the contents of any flu vaccine (excluding eggs), or who has developed Guillain-Barré Syndrome (GBS) within six weeks after receiving any flu vaccine, should not get vaccinated against the flu.

There is no need to delay immunization because of a cold or other mild illness. However, if you are concerned, speak with a health care provider.

Possible side-effects of the high-dose flu vaccine

It is much safer to get the vaccine than to get the flu. Health Canada approves vaccines based on a review of quality and safety.

Fluzone® High-Dose contains more influenza virus antigen than the standard-dose vaccine. Fluzone® High-Dose may cause more soreness, redness and/or swelling where the vaccine was given. Other common side-effects are fever, headache and tiredness. Acetaminophen (Tylenol®, Tempra® or generic versions) can be given for fever or soreness.

It’s important to stay in the clinic for 15 minutes after getting any vaccine because there is a rare possibility of a severe allergic reaction. This can include hives, difficulty breathing, or swelling of the throat, tongue or lips. If this happens, seek immediate medical attention.

Report any serious or unexpected side-effects to a health care provider.

Your record of protection

All immunizations, including the flu vaccine, are recorded on an individual’s immunization record in Manitoba’s immunization registry. This registry:

- allows health care providers to find out which immunizations you have had or need to have;
- may be used to produce immunization records or notify you or your health care provider if a particular immunization has been missed; and
- allows Manitoba Health, Seniors and Active Living and public health officials to monitor how well vaccines work in preventing disease.

The Personal Health Information Act protects your information. You can have your personal health information hidden from view from health care providers; talk to your health care provider for more information.
Seasonal Influenza Vaccine for Residents of Long-Term Care Facilities

Public health nurses are able to provide a copy of the immunizations that you have received. For a listing of public health offices, visit:
