

Water Quality Assessment Following Release of Raw Sewage from the City of Winnipeg, September 2002

**Dwight Williamson, Manager
Water Quality Management Section
Manitoba Conservation**

Outline

- **Describe water quality and biological monitoring**
- **Overview of results**
- **Concluding comments**

Background

- **Overflow began late afternoon, September 16, 2002 and continued until early afternoon, September 19, 2002**
- **Overflow discharge rate was approximately 2.4 m³/s**
- **Monitoring began early morning, September 17, 2002 and continued until September 23, 2002**

Background (continued)

- Flow rate in Red River ranged from approximately 185 m³/s to 154 m³/s during the overflow period (2 to 3 times higher than normal)
- Raw sewage was diluted between 65 and 77 times or comprised between 1 % and 1.5 % of the Red River flow

Background (continued)

- **Travel time to Lake Winnipeg was between 3 and 4 days**
- **Raw sewage would have reached Lake Winnipeg by September 20, 2002**

Water Quality and Biological Monitoring

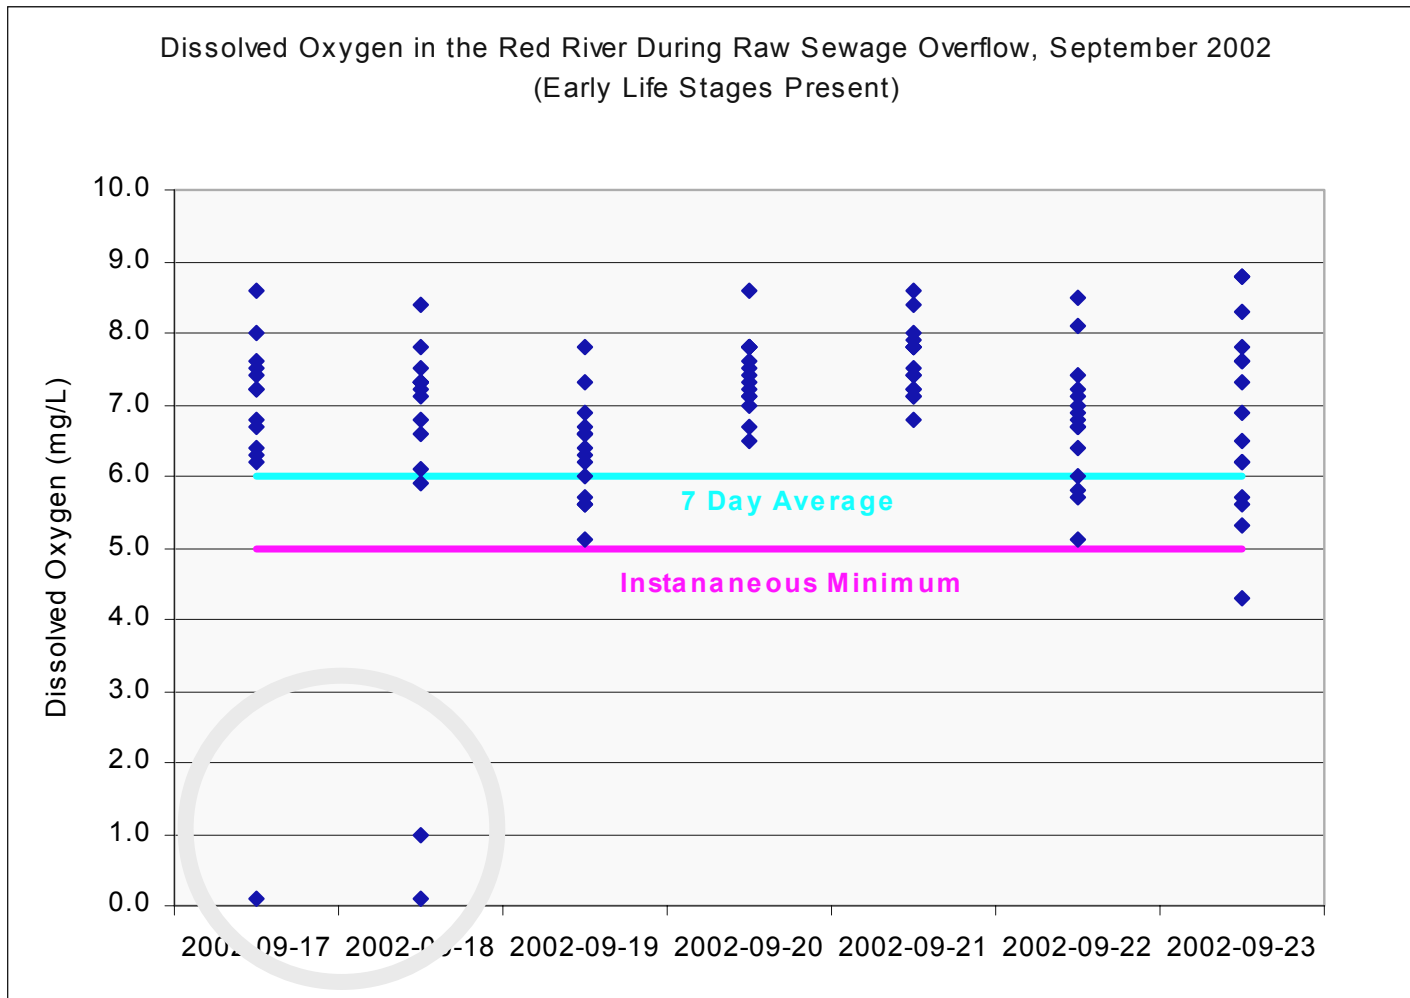

Jefferson Avenue Outfall

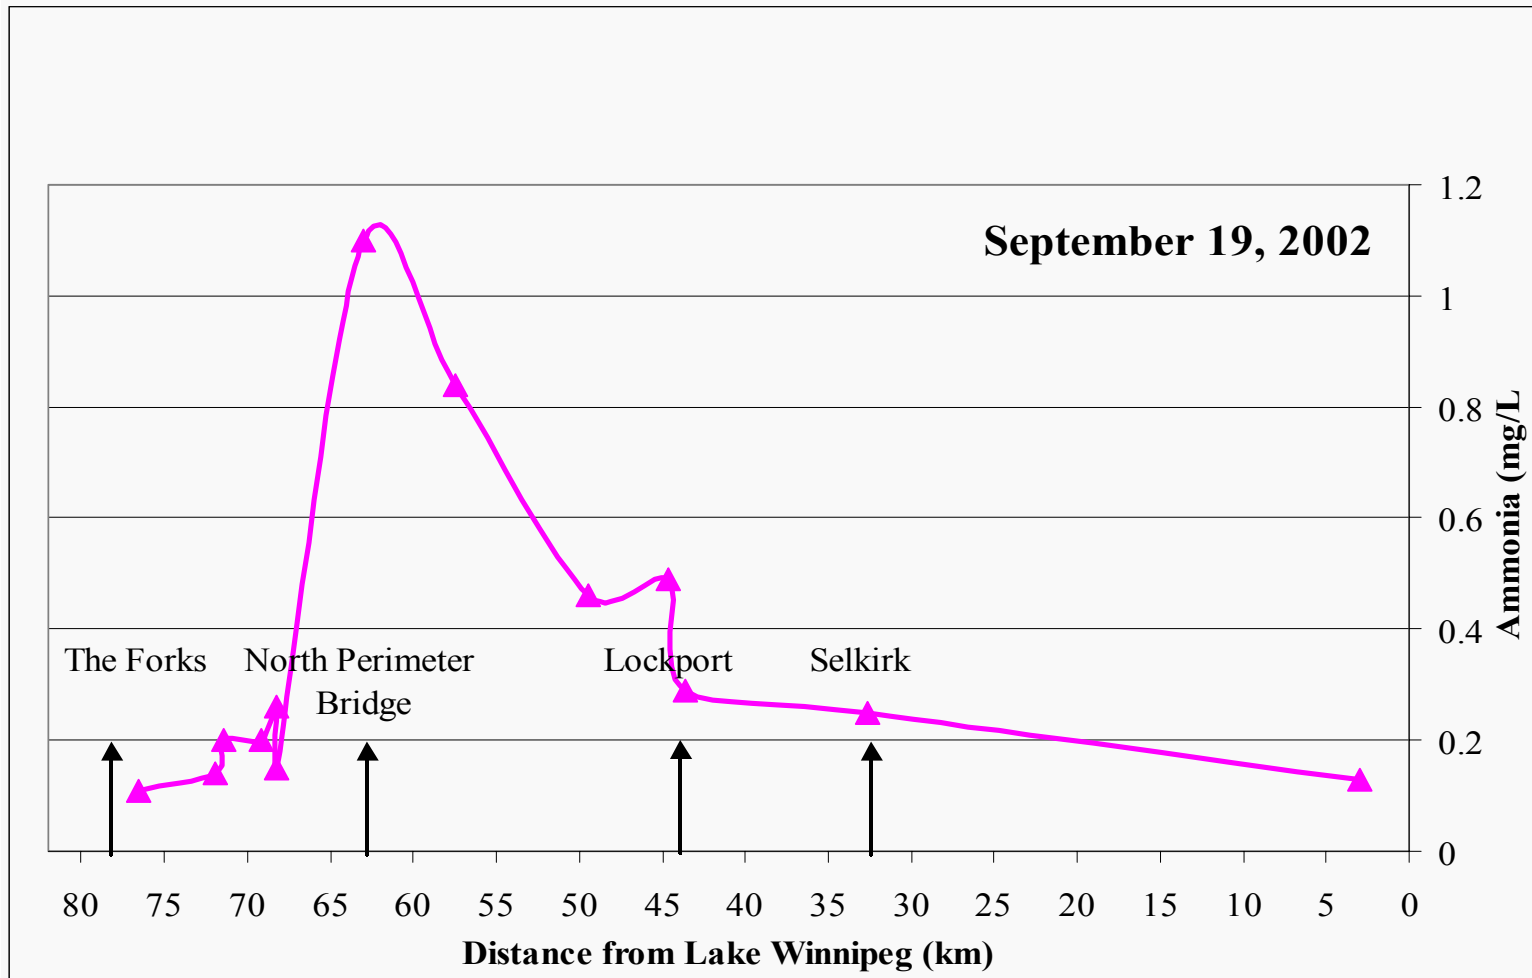

Dissolved Oxygen

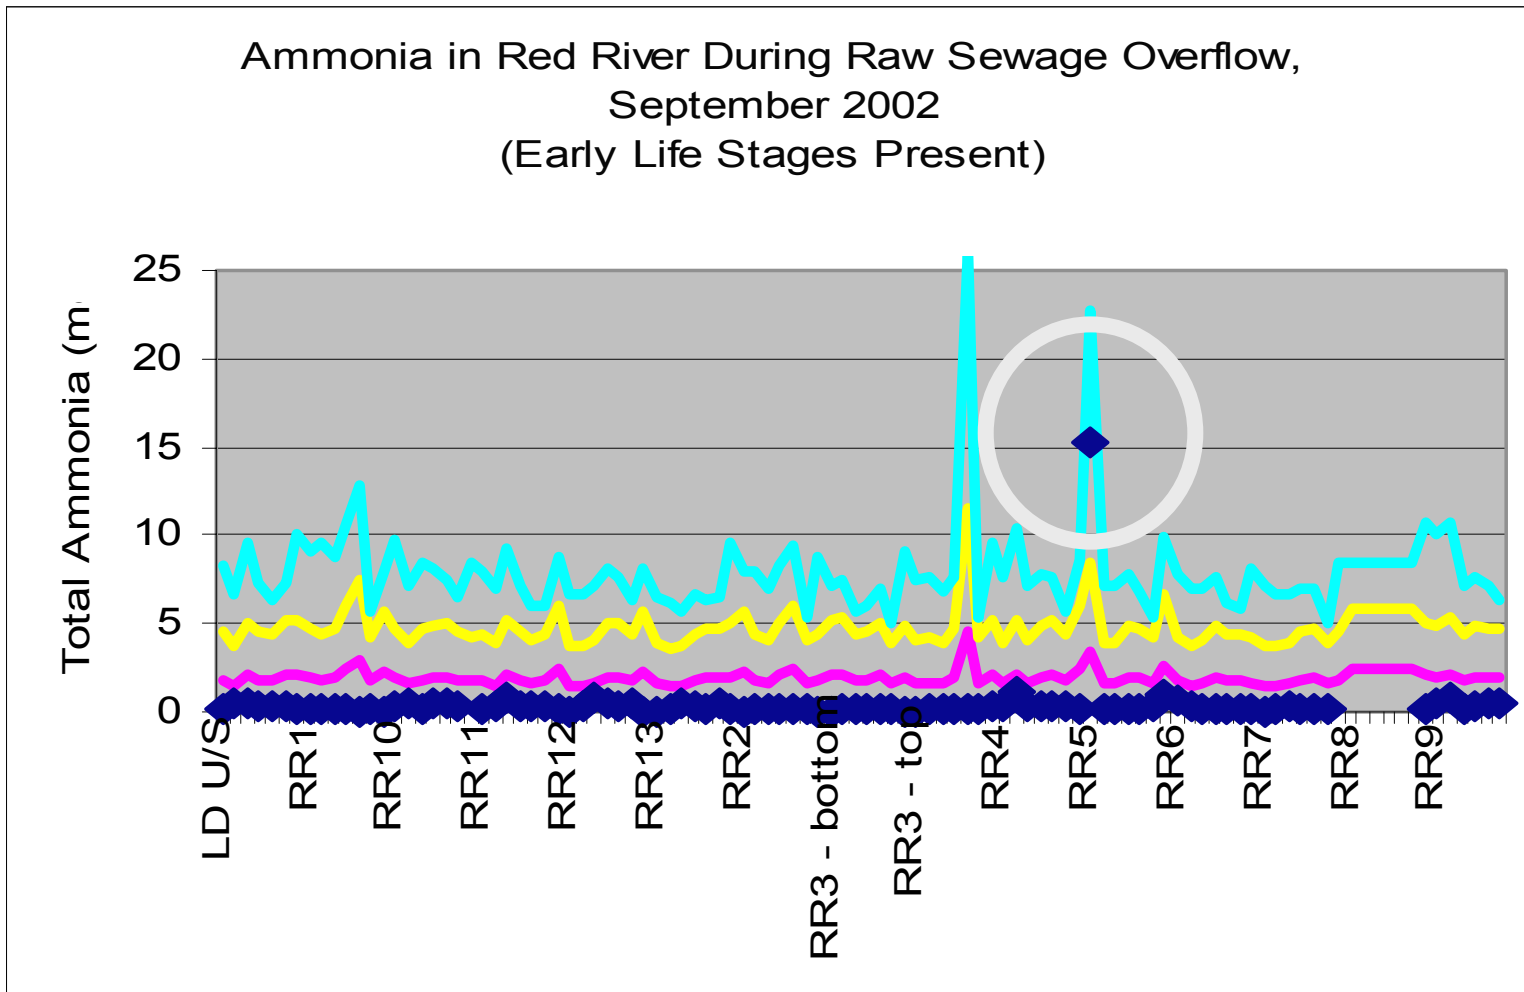

Dissolved Oxygen (continued)

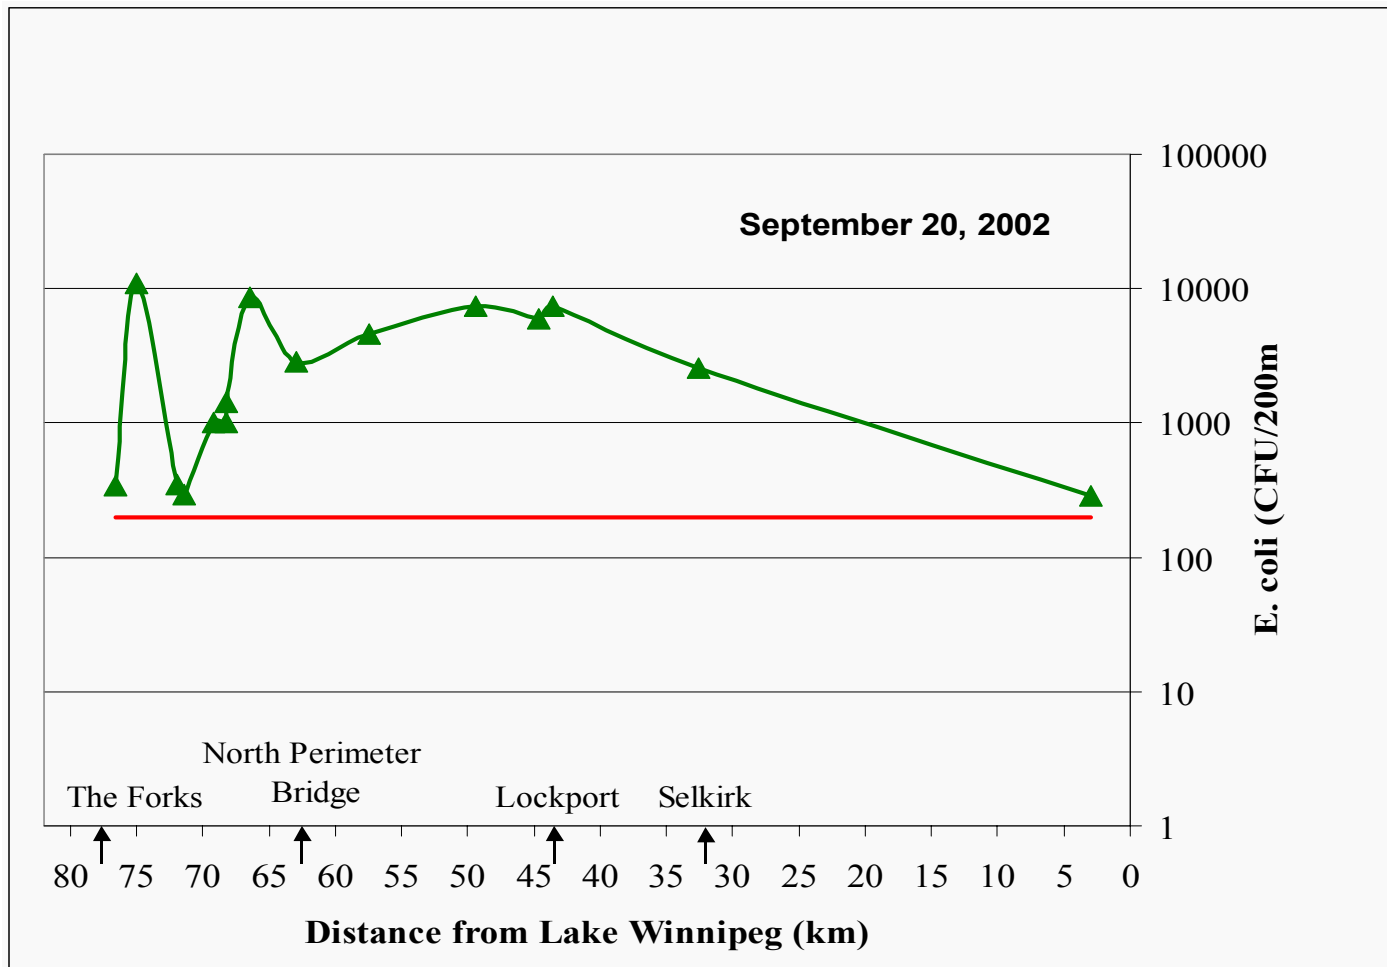

Ammonia

Ammonia (continued)

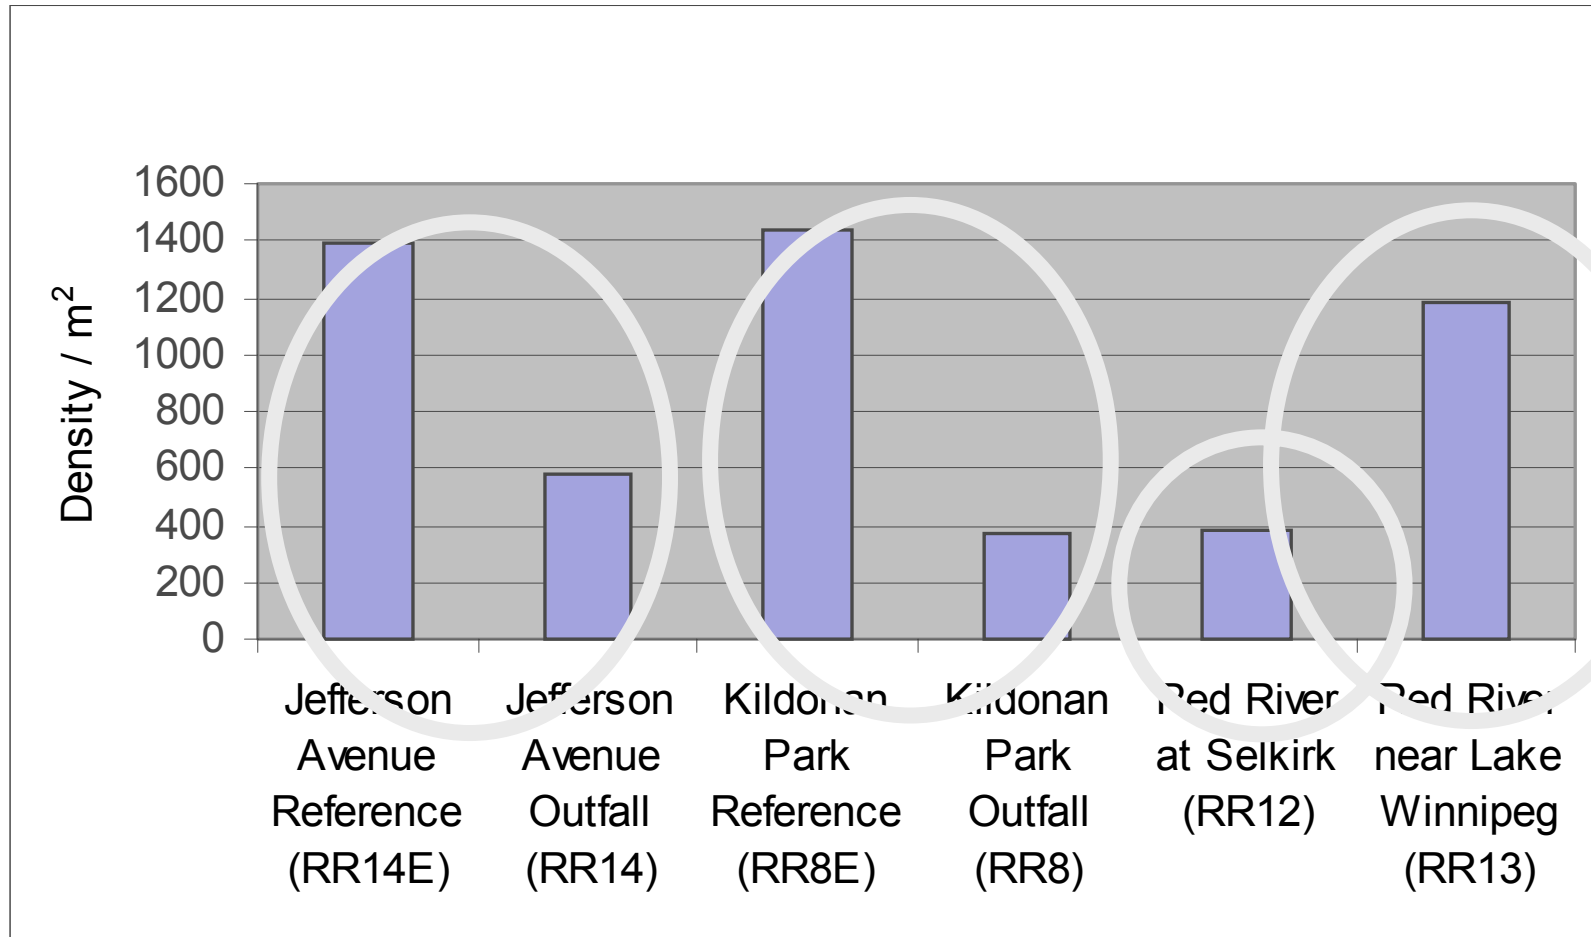

Fecal Coliform

Aquatic Invertebrates

Aquatic Invertebrates (continued)

Concluding Comments

- While impacts were detected, concluded that direct, short-term acute toxicity to aquatic life should not have occurred
- Chronic or long-term toxicity to aquatic life should not have occurred because of the short duration of the event

Concluding Comments (continued)

- The macroinvertebrate biological community remained unchanged in the Red River near Selkirk
- Uncertain about whether differences within the effluent plume and adjacent, unaffected areas were due to overflow or to normal within-stream variability

Concluding Comments (continued)

- **Bacteria densities were elevated above the normally high levels routinely observed downstream of Winnipeg**
- **Bacteria levels normally exceed the Manitoba Water Quality Standards, Objectives, and Guidelines in this reach**

Concluding Comments (continued)

- **At the site nearest Lake Winnipeg, bacterial densities exceeded the MWQSOG only on September 20, 2002**
- **Should a similar event occur under more typical, lower Red River flows or for a longer duration, significant impacts could be expected**

Thank You
