

# High Dose Seasonal Influenza Vaccine for Eligible Seniors Aged 65 Years and Older

## Public Health – Factsheet

Immunization is one of the most important accomplishments in public health that has, over the past 50 years, led to the elimination, containment and control of diseases that were once very common in Canada.<sup>1</sup> Vaccines help your immune system recognize and fight bacteria and viruses that cause diseases.

### What is seasonal influenza?

Seasonal influenza (the flu) is a respiratory infection caused by a virus. Not everyone who gets the flu develops symptoms, but they can still spread it to others, especially if they cough or sneeze. The flu may seem similar to other respiratory viruses or the common cold. However, the signs and symptoms are usually more severe than the common cold. Sudden high fever, body aches, extreme tiredness and dry cough are more common with the flu than the common cold. Other common symptoms include headache, chills, loss of appetite and sore throat. Nausea and upset stomach may also occur, especially in young children. The flu can lead to more serious problems like pneumonia and bacterial infections, sometimes resulting in hospitalization.

The flu can spread easily from person to person through coughing, sneezing or sharing food or drinks. You can also get the flu by touching objects contaminated with flu virus and then touching your mouth, eyes or nose. For this reason, it's important to cover your nose and mouth with your forearm when you cough or sneeze, avoid touching your face, and wash your hands often with soap and water (or use an alcohol-based hand sanitizer if soap and water are unavailable), especially after coughing and sneezing.

The flu season occurs each year. In Manitoba, it usually begins in the fall and lasts into the spring. For your protection, you should get immunized with the flu vaccine early in the fall before the flu starts to circulate.

### What is the flu vaccine?

There are many different strains of flu virus that circulate each year. The flu vaccine does not protect against all of them. Every year, scientists monitor the global spread of flu and decide which flu strains will likely cause the most illness during the upcoming flu season. Those strains are then put into the flu vaccine for that year. As a result, the vaccine can be different each year. For this reason, and because protection provided by the vaccine decreases over time, it's important to get the flu vaccine every year.

**The flu vaccine cannot offer protection against other viral or bacterial infections including illnesses like the common cold, stomach flus, or other respiratory illnesses including COVID-19.**

There are two types of influenza vaccines approved for use and available in Manitoba for older adults: the standard-dose influenza vaccine and the high-dose influenza vaccine. Both vaccines are administered by injection (needle) and are inactivated (not live). However, there are two main differences between the two influenza vaccines:

1. The high-dose influenza vaccine contains four times the amount of influenza virus antigen per strain compared to the standard-dose influenza vaccine
2. The high-dose influenza vaccine protects against three strains of influenza predicted to cause the most illness whereas the standard dose influenza vaccine protects against four flu strains.

### Who is eligible for the publicly-funded high-dose influenza vaccine as part of Manitoba's Seasonal Influenza Immunization Program?

Manitoba's Influenza Immunization Program offers high-dose influenza vaccine free-of-charge to the following individuals who are 65 years of age and older and are:

- Residents of long-term care facilities, including chronic care residents, OR
- Residents of supportive and assisted living housing, OR
- Clients in interim/transitional care beds, respite care clients as well as new, unimmunized residents admitted to a LTCF during the flu season, OR
- In a provincial correctional facility, including those who are newly incarcerated or transferred from other federal or out of province correctional facilities, OR
- Receiving homecare services while on a waiting list for admission into a long-term care facility, OR
- Living on a First Nation or remote/isolated community, OR
- Living north of the 53rd parallel of latitude

---

## Why should people get the flu vaccine?

Immunization against the flu has been shown to reduce the number of physician visits, hospitalizations and deaths, particularly among those who are at increased risk of serious illness from the flu.

Immunization is the best way to protect yourself against the flu, which can often be serious and sometimes fatal.

Vaccines help prepare your body to fight potential future exposure to the flu by getting your immune system ready.

The vaccine helps protect you, your family, and other people in your community.

## Who should get the flu vaccine?

An annual flu vaccine is available free-of-charge to all Manitobans six months of age and older as part of Manitoba's routine immunization schedule.

---

### **You should get immunized early in the fall before the flu starts to circulate.**

---

Getting an annual flu vaccine is especially important for Manitobans at increased risk of serious illness from the flu, their caregivers and close contacts. This includes:

- people 65 years of age and older
- residents of personal care homes or long-term care facilities
- children six to 59 months of age
- individuals with the following chronic health conditions:
  - an immune system weakened by disease or medical treatment
  - cardiac or pulmonary disorders (ex: cystic fibrosis, asthma)
  - long-term acetylsalicylic acid (Aspirin®) therapy (for those between six months and 18 years of age only)
  - neurologic or neurodevelopmental conditions
  - diabetes and other metabolic diseases
  - renal disease
  - anemia or hemoglobinopathy
  - obesity (body mass index  $\geq 40$ )
- pregnant women
- health care workers and first responders

- regular caregivers of children up to five years of age
- household contacts of anyone at increased risk of serious illness from the flu including those with infants under six months of age or expecting a newborn
- Indigenous peoples

## Who should NOT get the flu vaccine?

Anyone who has had a severe allergic reaction to a previous dose of any flu vaccine or to any of the contents of any flu vaccine (excluding eggs), or who has developed Guillain-Barré syndrome (GBS) within six weeks after receiving any flu vaccine, should not get vaccinated against the flu.

For specific details about the vaccine's ingredients, please visit the vaccine manufacturer's product monograph (link provided below) or speak with your health care provider.

There is no need to delay immunization because of a cold or other mild illness. If you are experiencing symptoms notify your immunization provider before getting immunized.

High-dose influenza vaccine is approved for use in those 65 years of age and older. As a result, anyone under 65 years of age should not be immunized with the high-dose influenza vaccine.

## Possible side-effects of the high-dose flu vaccine

It is much safer to get the vaccine than to get the flu. Health Canada approves vaccines based on a review of quality and safety.

The high-dose influenza vaccine contains more influenza virus antigen than the standard-dose influenza vaccine. The high-dose influenza vaccine may therefore cause more soreness, redness and/or swelling where the vaccine was given. Other common side-effects are fever, headache and tiredness. Acetaminophen (e.g. Tylenol®) can be given for fever or soreness.

It's important to stay in the clinic for 15 minutes after getting any vaccine because there is a rare possibility of a severe allergic reaction. This can include hives, difficulty breathing, or swelling of the throat, tongue or lips. If this happens, **seek immediate medical attention.**

---

**Report any serious or unexpected side-effects to a health care provider.**

## Your record of protection

All immunizations, including the flu vaccine, are recorded on an individual's immunization record in Manitoba's immunization registry. This registry:

- allows health care providers to find out which immunizations you have had or need to have
- may be used to produce immunization records or notify you or your health care provider if a particular immunization has been missed
- allows Manitoba Health, Seniors and Active Living, and public health officials to monitor how well vaccines work in preventing disease.

The Personal Health Information Act protects your information. You can have your personal health information hidden from view from health care providers. Talk to your health care provider for more information

Public health nurses are able to provide a copy of the immunizations that you have received. For a listing of public health offices, visit:

[www.manitoba.ca/health/publichealth/offices.html](http://www.manitoba.ca/health/publichealth/offices.html)

## For more information on the flu or the flu vaccine:

Talk to your health care provider.
