

LEGEND

This legend is common to GSC maps 2049A-2060A, and MGS geoscientific maps MAP2003-1 to MAP2003-12. Coloured legend blocks indicate map units that appear on this map. Not all map symbols shown in the legend necessarily appear on this map.

- QUATERNARY**
- NONGLACIAL DEPOSITS**
- O Organic deposits: peat, muck; <1-5 m thick; very low relief wetland deposits; accumulated in fen, bog, swamp, and marsh settings.
 - E Eolian sediments: fine sand; 1-5 m thick; dunes; formed by wind prior to stabilization by vegetation, in most cases on subaqueous outwash sand.
 - Lm Shoreline sediments: sand and gravel; 1-2 m thick; beaches; formed by waves at the margin of modern lakes.
- ALLUVIAL SEDIMENTS:** sand and gravel, sand, silt, clay, organic detritus; 1-20 m thick; channel and overbank sediments, deposited by postglacial rivers.
- Ap Overbank deposits.
 - Ac Channel deposits.

- GLACIOLACUSTRINE DEPOSITS**
- GLACIAL LAKE SHORELINE SEDIMENTS:** sand and gravel; 1-20 m thick; beach ridges, spits, bars, littoral sand and gravel; formed by waves at the margin of glacial Lake Agassiz.
- Ls Shoreline deposits.
 - Li Littoral deposits.

- OFFSHORE GLACIOLACUSTRINE SEDIMENTS:** clay, silt, minor sand; 1-20 m thick; very low relief massive and laminated deposits; deposited from suspension in offshore, deep water of glacial Lake Agassiz, commonly scoured and homogenized by icebergs.
- Lz Clayey to sandy silt.
 - Lc Clay to silty clay.

- GLACIOFLUVIAL DEPOSITS**
- Gs Subaqueous outwash: fine sand, minor gravel, thin silt and clay interbeds; 1-75 m thick; subaqueous outwash fans; deposited near the ice margin in glacial Lake Agassiz by meltwater turbidity currents, commonly restrepped by wave erosion and reworked by wind.

- ICE-CONTACT GLACIOFLUVIAL SEDIMENTS:** sand and gravel; 1-20 m thick; complex deposits; belts with single or multiple esker ridges and kames, as well as thin, low-relief deposits; deposited in contact with glacial ice by meltwater.
- Gc Predominantly derived from carbonate rocks.
 - Gp Predominantly derived from igneous and metamorphic rocks.

- GLACIAL DEPOSITS**
- T Till: calcareous silt diamict; 1-75 m thick; low-relief, commonly streamlined deposits; subglacial deposits; largely derived from carbonate rocks; thicker sequences consist of multiple units of varying texture, commonly scoured by icebergs; covered discontinuously by thin veneers (<1 m) of glaciolacustrine and glaciofluvial sediments.

- DISCONTINUOUS TILL AND ASSOCIATED GLACIOFLUVIAL SEDIMENTS:** gravelly silt to sand diamict, sand and gravel; 1-30 m thick; low-relief deposits between bedrock outcrops making up 25-75% of the area; sandy till interbedded and interspersed with nearly equal and often greater amounts of sandy glaciofluvial sediments, as well as minor glaciolacustrine sediments.
- Tc Predominantly derived from carbonate rocks.
 - Tp Predominantly derived from igneous and metamorphic rocks.

- PRE-QUATERNARY**
- ROCK:** >75% bedrock outcrop; Paleozoic carbonate-dominated rocks in areas west and south of Lake Winnipeg, exposed typically as glacially striated, low-relief surfaces; in Precambrian terranes, generally unweathered intrusive, metasedimentary, and metamorphic rocks having a glacially scoured irregular surface with high local relief; includes patches of thin glacial sediments and organic material.
- Rc Paleozoic sedimentary rocks.
 - Rp Precambrian igneous and metamorphic rocks.

- Geological boundary (approximate)
- Built-up area (map GSC 2055A / MGS MAP2003-7 only)
- Mine waste
- Peat-extraction area
- Gravel pit
- Mine or bedrock quarry
- Stabilized dunes
- Abandoned channel
- Minor beach ridge
- Wave-cut scarp
- Groundwater seeping channel
- Piping depression
- Iceberg scour
- Tunnel valley
- Esker (direction of flow indicated)
- Streamlined landform
- Glacial striae
- Crossed striae (numbers indicate relative age, 1 being the oldest)
- Small bedrock outcrop
