Attention: Mr. Warren Rospad
District Supervisor / Environment Officer
Environmental Compliance and Enforcement

Dear Mr. Rospad:

Re: Remedial Action Plan
Former Petro-Canada Service Station and Certigard Car Repair Facility
208 St. Anne's Road
Winnipeg, Manitoba
Outlet No. 63955

Under the authorization of Suncor Energy Inc. (Suncor), O'Connor Associates Environmental Inc., a Parsons Company (Parsons), has prepared the following remedial action plan (RAP). The proposed plan includes the excavation of impacted soil and entrained groundwater, the disposal of the excavated impacted soil and the backfilling of the excavation with imported fill material at the above referenced Site.

Specifically, this RAP concerns the removal of petroleum hydrocarbon impacted soil and entrained groundwater in the vicinity of the former tank nest and pump island areas located on the north and east portions of the Site.

The location of the Site is presented on Drawing No. 1. The former Site facilities are presented on Drawing No. 2. The borehole and monitoring well locations are presented on Drawing No. 3.

BACKGROUND INFORMATION

Site Location/ Description

The Site is located at 208 St. Anne's Road in Winnipeg, Manitoba. The Site is legally described as Lot 33-36, Block 3, Plan 2785 WLTO (Winnipeg Land Titles Office) and occupies an area of approximately 2394 m².

The Site formerly operated as a Petro-Canada Service Station and Certigard Car Repair Facility and currently operates as Penner Certified Auto Service Station. Former Site facilities included several petroleum USTs and associated product piping and dispensing equipment. Current Site facilities include a service building (with an inactive car wash) and one waste oil underground storage tank (UST).

The Site is zoned for commercial land use. Surrounding land is commercial to the north, east and south; and, residential to the west.

Regional Description

Previous assessments on-Site indicated the underlying native soil profile generally consisted of interlayered silt and clay which extended to the maximum depth of investigation, approximately 6.1 mbgs. Gravel fill material was encountered in the vicinity of the former tank nests to a depth of approximately 4.0 mbgs.

The nearest permanent natural surface water body is the Red River, located approximately 850 m west of the Site.

Groundwater in the area is typically not used as a source of drinking water or for industrial purposes. Potable water for the City of Winnipeg is obtained from Shoal Lake, Ontario, located approximately 125 km east of the city.

Previous Assessments and Contaminants of Concern

The soil and groundwater analytical results for benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions (PHC) fractions F1 to F4, lead, 1, 2-dibromoethane (DBA) and 1,2-dichloroethane (DCA) obtained during the most recent Site assessment work are summarized on Drawing Nos. 4 and 5.

During the assessment work, 1,2-DBA and 1,2-DCA were not detected in soil and groundwater above the assessment criteria ((Alberta Soil and Groundwater Remediation Guidelines (2010)) and therefore, are not considered contaminants of concern for remediation at the Site.

Arsenic was detected in soil at one location at depth (3.5 mbgs to 3.8 mbgs) at a concentration slightly higher than the assessment criterion (13 mg/kg vs. 12 mg/kg) ((Canadian Council of Ministers of the Environment (CCME) (2012)). This finding appears to be related to naturally occurring arsenic typically seen in clay soils within the region and therefore, is not considered a contaminant of concern for remediation at the Site.

Selection of Remediation Criteria

For the remediation work, Manitoba Conservation's direction to adopt the CCME *Canadian Environmental Quality Guidelines* (2012) and *Canada Wide Standards (CWS) for Petroleum Hydrocarbons in Soil* (2008) will be followed.

The applicable exposure pathways were selected based on the following information.

- Fine-grained soils, as determined during previous Site investigation activities;
- According to the City of Winnipeg, the Site is currently zoned for commercial land use;
- The City of Winnipeg is supplied with potable water from Shoal Lake, located approximately 125 km east of the City; and,
- The nearest permanent natural surface water body is the Red River, located approximately 850 m west of the Site.

Based on the above discussion, criteria concerning fine-grained soils in a commercial land use setting, with the potable and freshwater aquatic life pathways excluded, were selected.

The selected applicable remediation soil criteria are those presented under the CCME CEQG *Canadian Soil Quality Guidelines for the Protection of Environment and Human Health* (2012) Tables 2 and 3 Soil quality guidelines and check values for BTEX and lead; and the CCME CWS (2008) Table 2 Tier 1 levels for PHCs for fine-grained surface soils and Table 4 Tier 1 levels for PHCs for fine-grained subsoils for PHC fractions F1 to F4.

A detailed summary of the selected soil remediation criteria is presented in Table 1.

TABLE 1
REMEDIATION CRITERIA
PETROLEUM HYDROCARBON PARAMETERS AND LEAD

	B	T	E	X	F1	F2	F3	F4	Pb
Surface Soil	2.8 ^{a,b}	330 ^b	430 ^b	230 ^b	320 ^{c,d}	260 ^{c,e}	2500 ^{c,f}	6600 ^c	260 ^e
Subsoil	2.9 ^{a,b}	660 ^b	860 ^b	460 ^b	800 ^{c,d}	1000 ^{c,e}	5000 ^{c,f}	10000 ^c	260 ^e

- a - Canadian Council of Ministers of the Environment (CCME); Canadian Environmental Quality Guidelines (2012); Soil quality guidelines and check values in surface soil – fine-grained soils, commercial land use
- b - human health guidelines/check values – 10^{-5} incremental risk
- c - CCME; Canadian Wide Standards for Petroleum Hydrocarbons in Soil (2008); Tier 1 levels for PHCs for fine-grained surface soils – commercial land use
- d - BTEX to be not included in fraction
- e - Naphthalene to be included in the fraction
- f - PAHs to be included in the fraction
- g - CCME; Canadian Environmental Quality Guidelines (2012); Soil quality guidelines and check values – commercial land use
Soil criteria listed in milligrams per kilogram (mg/kg) on a dry weight basis.

REMEDIAL EXCAVATION/MANAGEMENT PLAN

The excavation, transporting and backfilling activities will be conducted by Tervita Corporation (Tervita) under contract to Suncor. Parsons personnel will assist the contractor with the management of the petroleum impacted soils and the determination of the extent of the excavation. Remediation of the Site will tentatively commence in Summer 2013. The following presents details concerning the excavation activities.

Excavation Limits and Volumes

The most probable extent of remedial excavation limits and volume were derived based on previous Site assessment findings concerning impacted soil and entrained groundwater at the Site. It is estimated that approximately 2620 m³ of impacted soil and entrained groundwater is expected to be excavated.

The most probable extent of remedial excavation limits and volume are presented on Drawing No. 6.

Waste Disposal Site

Excavated soils will be transported and treated at the Mid Canada Soil Recycling Facility located in Ile de Chenes, Manitoba.

Soil Screening and Sampling

Soil screening samples will be collected from the final floor of the excavation on an approximate 2 m by 2 m grid. Soil screening samples will be collected from the final walls of the excavation on an approximate 1 m by 2 m grid.

Soil samples from the excavation margins will be selected for laboratory analyses based on physical observations and/or field screening results. Worst case samples (based on field screening results) from the excavation wall and floor grid will be submitted for laboratory analysis. In general, one sample from every column on the walls of the excavation and ten percent of the floor samples will be submitted for laboratory analysis.

Potential Dewatering

Groundwater which may accumulate during excavation activities will be removed by vacuum truck and transported offsite for disposal by a licensed waste hauler to a licensed facility for treatment, if required.

Excavation Backfill

Prior to remedial excavation activities, samples of the proposed imported backfill material will be submitted for a suite of laboratory analyses to ensure compliance with remediation objectives. In addition, imported backfill material will be selected to correspond with native stratigraphy.

We trust that the enclosed information is satisfactory for your present requirements. Should you have any questions or concerns, please contact the undersigned.

Respectfully submitted,

O'CONNOR ASSOCIATES ENVIRONMENTAL INC., A PARSONS COMPANY
