INTRODUCTION

The Waskada Unit No. 9 pressure maintenance project commenced water injection into the Mission Canyon designed and in accordance with Manitoba Energy and Mines Approval No. PM 49. (See Appendix A- Area Map)

PRESSURE MAINTENANCE: Governed by Board Order No. PM 49

Unit Information:

UNITIZED ZONE: Mission Canyon

Original Unit, April.1, 1986 - Board Order; Voluntary

POOL: Waskada Mission Canyon 3b B (03 42B)

POOL: Waskada Mission Canyon 3a C (03 43C) – one well only 11-27-1-26

This report documents the performance of the Waskada Unit No.9 pressure maintenance project for the period of January 1 to December 31, 2011.

Unit # 1 is part of main Waskada. The Waskada field is situated on the northeast rim of the Williston Basin in southern Manitoba. It comprises a large portion of Township 1 and 2, Ranges 25 and 26 (WPM).

The Waskada Fields produce light density crude (approximately 36° API), predominantly from the Lower Amaranth formation. The interlaminated, shallow marine to subtidal succession of sandstones, siltstones, and shale progressively onlaps the Mississippian unconformity surface from basin center, up dip to the north and eastern basin limits in Saskatchewan and Manitoba. The fine grained reservoir rock has a complex reservoir characterization with 13 to 16 % porosity and permeability on the order of 0.5 to 15 md. The lower Amaranth, the oldest Mesozoic unit is a clastic red bed sequence lying directly on the Paleozoic erosional surface. It consists of a series of dolomitic siltstones and sandstones interbedded with argillaceous siltstones and shales. The section is usually subdivided into a lower sandy unit and an overlying shale unit. The lower sequence is the

oil production zone. The bulk of pay is founded in the laminated sandstone/siltstone facies.

The Lower Amaranth has been classified into four general lithological types:

1. Interbedded shale/siltstone/sandstone by grain size, color and texture
2. Siltstone – This lithology occurs in distinct intervals up to two or three meters in thickness. It is generally light green in color and dolomitic.
3. Laminated sandstone – This occurs in distinct sandy intervals with a wide range of grain sizes and primary sedimentary structures.
4. Massive sandstone – This lithology occurs in thin intervals and usually associated with the laminated sandstones facies. Beds are usually light grey to reddish grey in color and coarse to medium – grained.

UNIT HISTORY

Waskada Unit # 9 (Unit History)

DISCUSSION:

Production Performance

The Waskada MC3b B Pool was discovered in September, 1982 with the completion of the well Omega Waskada 11-27-1-26 in the MissionCanyon 3b zone over the interval 927.0 to 930.0 m KB. Board Order No. PM 49 provided for pressure maintenance operations in theWaskada Unit No.9. The Unit includes several producers in the Waskada MC3b BPool and the two injectors. On February 5, 1986, Omega Hydrocarbons Ltd., as operator of the proposed Waskada Unit No.9, has made application for approval to conduct pressure maintenance operations in the Waskada MC3b Pool. Omega started to inject water in two wells (located in Lsd 11 of Section 27-1-26 and in Lsd 1 of Section 34-1-26).

Appendix B is a plot of Unit performance and shows the production and injection profiles. The pressure maintenance scheme will involve the injection of produced water into the Mission Canyon 3bB formation through wells 11-27 and 1-34-1-26 WPM to maintain reservoir pressure and "sweep" oil towards the offsetting production wells, but it did not impact the produced fluid. (Appendix D-see oil, water and injection rates)
On December 2, 1988, Omega Hydrocarbons Ltd., operator of the Waskada Unit No. 9 has made an application under Pressure Maintenance Rule No. 1(3) of Board Order No. PM 49 and suspended the water injection into the subject wells.

Voidage Replacement Ratio Calculation

Upon review of the voidage replacement ratio (VRR) for the Waskada Unit # 9 area, it was shown that the area has been under injected. There is no active injector in this unit. This is shown by instantaneous and cumulative VRR for the Waskada Unit # 9 (Please see the Appendix C).

Corrosion and Scale Prevention Program

We currently inject ScalCor down all the new horizontal wells. Plus, PennWest will be installing cathodic protection on the wells. Also, the new gathering system is Fiberglass and as such is not susceptible to corrosion.

SUMMARY AND RECOMMENDATIONS

Producers:

Current Producing Wells

1. 00/14-27-001-26W1/0

Current Suspended Producing Wells

None

Abandoned Producing Wells

1. 02/12-27-001-26W1/2 (since 1993/03)
2. 00/13-27-001-26W1/0 (since 1996/03)
3. 02/13-27-001-26W1/2 (since 1991/05)
4. 00/15-27-001-26W1/0 (since 1989/11)
5. 02/15-27-001-26W1/2 (since 1991/03)
6. 00/16-27-001-26W1/0 (since 1991/05)
7. 02/16-27-001-26W1/2 (since 1996/07)
8. 00/02-34-001-26W1/0 (since 1983/09)

Injectors

Current Injecting Wells

None

Current Suspended Injection Wells

None

Abandoned Injection Wells

1. 00/01-34-001-26W1/0 (since 1988/02)
2. 00/11-27-001-26W1/0 (since 1987/01)

Since there is only one producer and no injection well in this unit, we do not have any plan for this unit other than monitoring the only producer.
